Executive Summary

This report introduces how to start with AWS Educate for students and faculty at Arcadia University. One of the major AWS services, EC2, will be described in detail in order to provide a better understanding how to create your own virtual machines in the cloud and connect to them using a terminal and graphical interface. Cloud9 will be mentioned at the end of the report. If there is a need for describing how to work with other AWS services, I will be glad to add that here as well – let me know.

Faculty will learn how to create AWS classrooms for their students.

I can run hands-on workshops a few times per semester for interested people or meet individually to work on / discuss a specific problem when time permits.

Why Cloud Computing?

AWS is one of the major cloud computing providers (some other ones are Google Cloud, Microsoft Azure, and IBM Cloud). AWS Educate allows faculty to get \$200 worth of free credits every year to use AWS in research and teaching. Additionally, faculty can easily create classrooms for students, allocating for each of them \$50 of free credits for every class (you can request more if needed for larger projects). A few reasons why cloud computing is useful for computer science and math:

- Running multiple virtual machines that are much more powerful than anything we have to compute, research, mine and analyze big data, and run complex machine learning models including:
 - Tensor flow
 - Natural language processing and text analytics
 - AWS DeepLens (smart IP camera)
 - Conversational interfaces based on Alexa (e.g., for chatbots or virtual reality guides)
 - Text-to-lifelike speech, streaming it directly to apps
 - Existing cloud API for automated image/voice/video processing and analysis
 - Translation services
- Running your applications (web, mobile, commerce, research, testbeds) on servers that will be accessible from the Internet to anyone.
- Having encrypted, secure storage for your data in the cloud.
- Downloading/uploading big data and working on it in the cloud at unlimited storage and computational power.
- Building virtual reality and virtual robotics applications.
- Working with databases and using those in teaching (e.g., AWS DynamoDB is a NoSQL database that allows for 25GB per month for free at any given time). AWS PostgreSQL and MySQL are wonderful as well for teaching students how to use SQL-based databases and connect them with the apps.
- Creating private networking infrastructure with multiple virtual machines interconnected among each other (with routing, firewalls, etc.)
- Serverless computation (running your code without a server, paying only when your users actually browse your web pages / use your mobile apps): AWS Lambda.

- Having a cloud Integrated Development Environment that will be automatically set up for you without the need to install any software on your computer: AWS Cloud9.

Who Can Benefit from Cloud Computing at Arcadia?

- Anyone who works with big data processing on campus will benefit from cloud computing.
- If you need to install a specific software that is not feasible to install on laptops and lab computers (e.g., galaxy server for bioinformatics), then cloud computing is the way to go, especially if you want to make it available at high speeds to all your students.
- Anyone who is interested in running machine learning models on any kinds of data (text, audio, video, images) but does not want to tinker with setting up the software on the personal or lab machines, especially if you are not comfortable with setting up and configuring machine learning software on your own (the cloud will do that for you).
- Anyone who has only one license for specific software and wants to allow others to use that software.
- Anyone who wants to create web and mobile servers and applications that would be publicly available on the Internet.
- Anyone who is going into the field of IT/CS.

Where Arcadia Students Learn about Cloud Computing

I teach students cloud computing (AWS Educate and sometimes Google Cloud) in CS358 Operating Systems and CS362 Computer Organization and Architecture courses. The students who took one of those courses will be prepared to work in the cloud on their own. This skill could be especially useful in the Capstone projects.

AWS Educate Registration

You can start the registration process here <https://www.awseducate.com/registration>. Choose Educator or Student depending on who you are at your Institution.

Students

Registration

During the registration process, students should choose a Starter account if they are applying separately from a classroom. They will be given \$75 worth of AWS credits per year until they graduate.

Educators

Registration

Educators will be asked to add a credit card to the account. It will not be charged. However, you should be aware that if you run out of the \$200 credits that are given to you every year and you continue using the AWS resources, you will be automatically charged on your credit card.

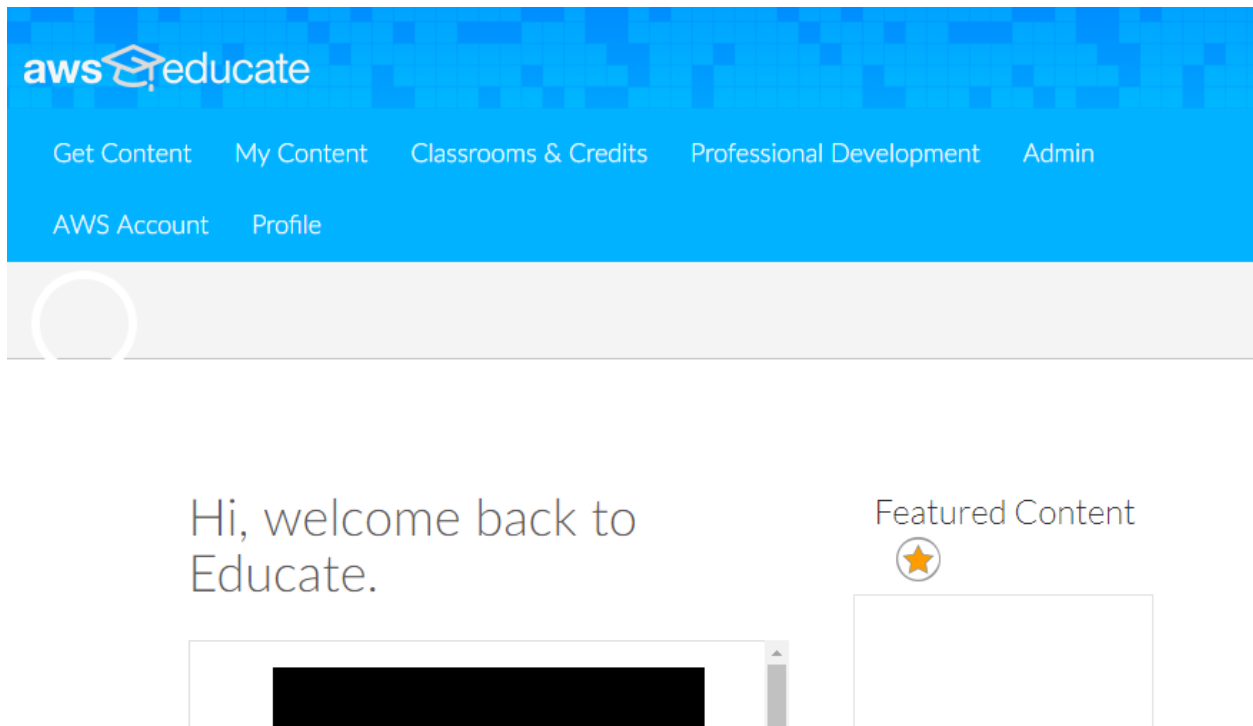

If the charges are accidental, you can dispute those and AWS has been lenient to withdrawing the charges if those happened by mistake (e.g., you forgot to shut down the server and it ran for a month). The bills come every month in case if your credit card is being charged.

Classrooms

After registration, Educators can request classrooms in their accounts and when approved (it may take a few days), Educators can upload an email list of students in that classroom. Afterward, the students will receive separate emails from AWS with the instructions on how to proceed, without the need to register on awseducate.com beforehand.

Create Classroom

Login to awseducate.com. Click on Classrooms & Credits.

Click on “Request or go to an AWS Educate Classroom”.

AWS Educate for Your Class

If you are a middle school or high school teacher with students between the ages 14 and 17, you can streamline the registration process by requesting a custom signup link for your students.

[Click here to learn more](#)

Request or go to an AWS Educate Classroom

Request or access your AWS Educate Classrooms. Follow a simple 3-step process to get started and provide your students with free and easy access to the AWS Console for homework, labs, and projects.

Select up to 3 classroom templates that define what services will be allowed for students to use. E.g., AWS Cloud Basics, Big Data, and Machine Learning and AI.

1 Select Classroom Template (maximum 3)

AWS Cloud Basics ✓Selected

Services enabled: EC2, S3, RDS

Use the AWS Cloud Basics to introduce students to fundamentals of AWS and to cloud computing concepts. Student can get their first Linux instance up in the cloud with EC2, store and access file to create a static web site using S3, create and operate their first database using RDS, and learn about security and access control with

[Read more](#)

Big Data ✓Selected

Services enabled: EC2, Athena, DynamoDB, EMR, Glue, RDS, S3

Teach big data applications such as clickstream analytics, fraud detection, recommendation engines, event-driven ETL, and internet-of-things processing with the Big Data template. Easily provision EMR clusters for Hadoop, Spark, and other big data learning. Learn SQL vs NOSQL

[Read more](#)

Machine Learning and AI ✓Selected

Services enabled: Machine Learning, Rekognition, Lex, Polly, Comprehend, Translate, Transcribe, SageMaker, DeepLens, Personalize, Forecast, Robomaker

Build a chatbot, access voice services with Lex and Polly, use image Rekognition, or use sophisticated machine learning models tools like

[Read more](#)

Building Scalable Websites

Services enabled: EC2, S3, RDS, ELB

Introduce students to building and hosting scalable, elastic websites on AWS. Use EC2 for compute, S3 to store site content, and ELB to dynamically scale based on demand.

Click on Next at the bottom and then fill up your classroom's information. You can have as many classrooms as you want but you will need to redo these steps separately for every classroom.

The screenshot shows a web form titled 'Enter Classroom Details' as part of a three-step process. Step 1 is 'Select Classroom Template (maximum 3)' and Step 3 is 'Upload a List of Email Addresses'. The current step, Step 2, contains several input fields: 'Course Name', 'Course Number', 'Course Description' (with a rich text editor icon), 'Course Info Link', 'Course Start Date', 'Course End Date', 'Classroom Needed By Date' (all with calendar icons), 'Credit Amount Requested Per Student' (pre-filled with '\$50'), and 'Estimated Enrollment'. There is also a checkbox labeled 'Would you be interested in contributing some or all of your course content?'. An orange 'Next' button is located at the bottom right of the form.

After you filled up all the information with \$50 credit requested, click Next. Then download the template that they provide (which is just an Excel spreadsheet with one column, in which you will insert the email addresses of your students, one per row). Fill up the template and upload it on that page. Finish the application and you will receive an email when it is ready to go.

[Add/Remove Students & Resend Invite](#)

Your students will automatically receive an email from AWS but if someone did not or you want to add another student, you can do so as well in the created classroom. To do that, go to "Classroom & Credits" and select "Request or go to an AWS Educate Classroom". Click on "Go to my classrooms" link that is on the right side of the page.

Request an AWS Educate Classroom

Use AWS Educate Classrooms ("Classrooms") to set up an a hands-on learning environment for your students to apply and practice on AWS. You can request a classroom in three steps:

Step 1: select from pre-built Classrooms in our most in-demand topics, including: Building Scalable Architectures using AWS, Cloud Basics, AWS Cloud9, and Big Data & Analytics, Machine Learning & Artificial Intelligence (including Amazon SageMaker), and Serverless Applications.

Step 2: Enter classroom detail such as course description, numbers of students, and request an allocation of AWS Promotional Credits for students.

Step 3:Upload a list of email address to invite students to join the Classroom, monitor usage and view activity.

[Go to my classrooms](#)

Note: Email addresses of previously invited students are not displayed if they declined the invitation.

1

2

3

At the bottom, you can invite by email, resend the invite, or remove students from the classroom. You will also be able to add student emails in bulk at the very bottom of that page.

[View Resource Allocation and Credits Left per Student](#)

If you clicked on “Go to classroom”, it will tell that you will be redirected to Vocareum website. After you accept, it will show you your classroom.

If you want to see how much money every student used per day, you can click on Accounts.

Computations and EC2 Virtual Machines

Introduction

EC2 is a service that allows us to create virtual machines with almost any hardware configurations we want in a blink of an eye. Moreover, if at some point during our work we want to change the current hardware configuration without losing our data, it is as simple as shutting the machine down, changing its hardware properties to the ones we want, and booting it back up. It takes just a few minutes.

Launching an Instance

This is the EC2 dashboard that shows your current EC2 resource usage and allows you to launch a new virtual machine (instance):

After clicking on Launch Instance, you are brought up with a page that asks you select a template to run your server. Most commonly used templates are Ubuntu Server (for Linux side) and Windows Server (for Windows side). We will select Ubuntu 18.04 by searching for it in the search field:

The screenshot displays the AWS Management Console interface for selecting an Amazon Machine Image (AMI). The top navigation bar includes the AWS logo, 'Services', 'Resource Groups', and a search icon. Below the navigation bar, a progress bar indicates the current step: '1. Choose AMI'. The main heading is 'Step 1: Choose an Amazon Machine Image (AMI)', with a 'Cancel and Exit' link. A descriptive paragraph explains that an AMI is a template containing software configuration. A search bar at the top of the content area contains the text 'ubuntu'. On the left, a 'Quick Start (7)' sidebar lists categories: 'My AMIs (0)', 'AWS Marketplace (211)', and 'Community AMIs (34195)', along with a 'Free tier only' checkbox. The main content area shows a list of AMIs. Two Ubuntu Server AMIs are visible: 'Ubuntu Server 18.04 LTS (HVM), SSD Volume Type' and 'Ubuntu Server 16.04 LTS (HVM), SSD Volume Type'. Both are marked as 'Free tier eligible'. Each entry includes the AMI ID, architecture (64-bit x86 or 64-bit Arm), a description, and a 'Select' button. The bottom of the console shows the 'Root device type: ebs', 'Virtualization type: hvm', and 'ENA Enabled: Yes'.

Next, you can select the hardware configuration that you want this server to use. By default, type t2.micro is selected that has 1 processor and 1 GB of RAM (hard disk / SSD will be chosen later). The types vary by the number of processors and RAM available on that machine. The more, the costlier. You can read more about pricing here: <https://aws.amazon.com/ec2/pricing/>

As an example, a machine with 1 processor and 1 GB RAM costs 0.0116/Hour whereas a machine with 96 processors and 384 GB RAM costs \$4.608/Hour. We will go with the default configuration.

6. Configure Security Group
7. Review

Step 2: Choose an Instance Type

Amazon EC2 provides a wide selection of instance types optimized to fit different use cases. Instances are virtual servers that can run applications. They have varying combinations of CPU, memory, storage, and networking capacity, and give you the flexibility to choose the appropriate mix of resources for your applications. [Learn more](#) about instance types and how they can meet your computing needs.

Select an existing key pair or create a new key pair

A key pair consists of a **public key** that AWS stores, and a **private key file** that you store. Together, they allow you to connect to your instance securely. For Windows AMIs, the private key file is required to obtain the password used to log into your instance. For Linux AMIs, the private key file allows you to securely SSH into your instance.

Note: The selected key pair will be added to the set of keys authorized for this instance. Learn more about [removing existing key pairs from a public AMI](#).

Create a new key pair

Key pair name

AWS key for Ubuntu 18.04

[Download Key Pair](#)

You have to download the **private key file** (*.pem file) before you can continue. **Store it in a secure and accessible location.** You will not be able to download the file again after it's created.

14

Our newly created machine does not have any name yet, so click on it and enter the name that you will recognize later:

Starting/Stopping/Terminating Instances

IMPORTANT: do not forget to stop your machine when you are not using it so that you will not incur any charges (storage is dirt-cheap on the cloud but computation does cost money). To do that, select the machine, then click on Actions. Select Instance State and Stop/Start depending on what you want to do at the moment. If you want to delete the machine completely (meaning that it will be gone forever), select Terminate in the Instance State.

Access the Instance

Now that you created the instance and called it Ubuntu, you can connect to it by using the key you have previously downloaded and software called SSH (Secure Shell). If you are currently working on Mac OS or Linux, you will be able to enter the following command in the terminal (after navigating the terminal to the folder where your key is located):

```
ssh -i AWSkeyforUbuntu1804.pem ubuntu@public_ip_address
```

where `public_ip_address` is the machine's public IP address found at the bottom right when you select the machine in EC2 (in my case, it is 54.196.228.206); and `ubuntu` (preceding `@` sign) is the default username.

The screenshot shows the AWS Management Console interface. On the left is a navigation sidebar with categories like INSTANCES, IMAGES, ELASTIC BLOCK STORE, and NETWORK & SECURITY. The main area displays a list of EC2 instances. Three instances are listed: 'gencybercoin-dev', 'Ubuntu 18-04', and 'Ubuntu'. The 'Ubuntu' instance is selected, highlighted in blue. Below the list, the details for the selected instance 'i-0ff7614ae80be8ca8 (Ubuntu)' are shown. The details include the instance ID, public DNS, instance state (running), instance type (t2.micro), availability zone (us-east-1d), and security groups.

Name	Instance ID	Instance Type	Availability Zone	Status
gencybercoin-dev	i-01a5fe114cf361d8e	t2.nano	us-east-1b	Running
Ubuntu 18-04	i-020818f09be76329c	t2.micro	us-east-1d	Stopped
Ubuntu	i-0ff7614ae80be8ca8	t2.micro	us-east-1d	Running

Instance: i-0ff7614ae80be8ca8 (Ubuntu)			
Public DNS: ec2-54-196-228-206.compute-1.amazonaws.com			
<div> <div>Description</div> <div>Status Checks</div> <div>Monitoring</div> <div>Tags</div> </div>			
Instance ID	i-0ff7614ae80be8ca8	Public DNS (IPv4)	ec2-54-196-228-206.compute-1.amazonaws.com
Instance state	running	IPv4 Public IP	54.196.228.206
Instance type	t2.micro	IPv6 IPs	-
Elastic IPs		Private DNS	ip-172-31-94-35.ec2.internal
Availability zone	us-east-1d	Private IPs	172.31.94.35
Security groups	launch-wizard-16	Secondary private IPs	

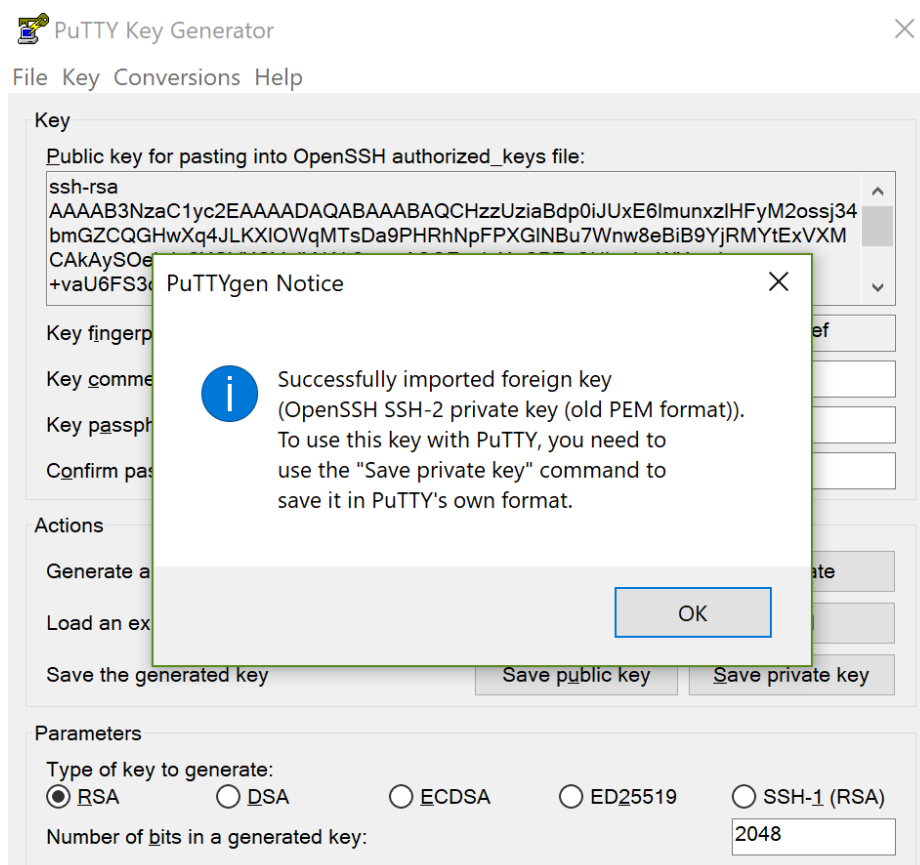

If you are on Windows, then you will need to either enable SSH in the Optional Features available in the Apps and Programs or use puttygen to generate the putty key and then use putty to connect as described below.

Download puttygen and putty from <https://www.chiark.greenend.org.uk/~sgtatham/putty/latest.html> (64-bit will be fine unless you are using an old machine that is 32-bit). Open puttygen and Load the key that you have downloaded from AWS when you created the Ubuntu instance.

Make sure that when you click on Load in puttygen, in the popped up window you select All files in the bottom right corner to show all files (to actually see the key itself, otherwise it will not show it to you).

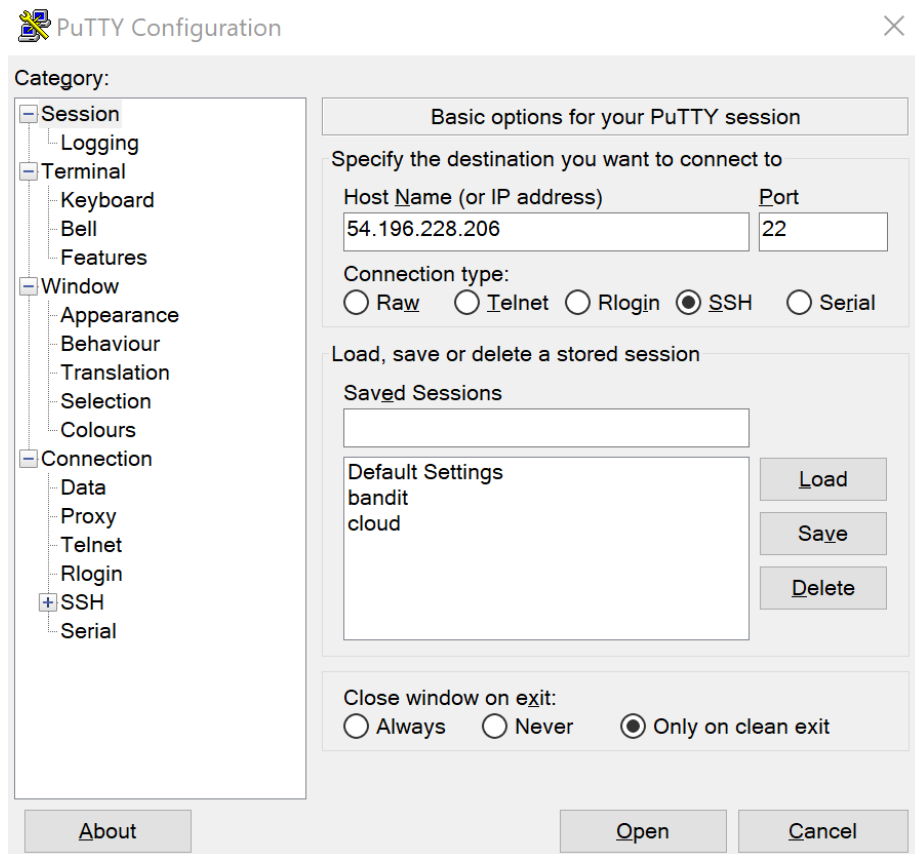

It should show you this window next:

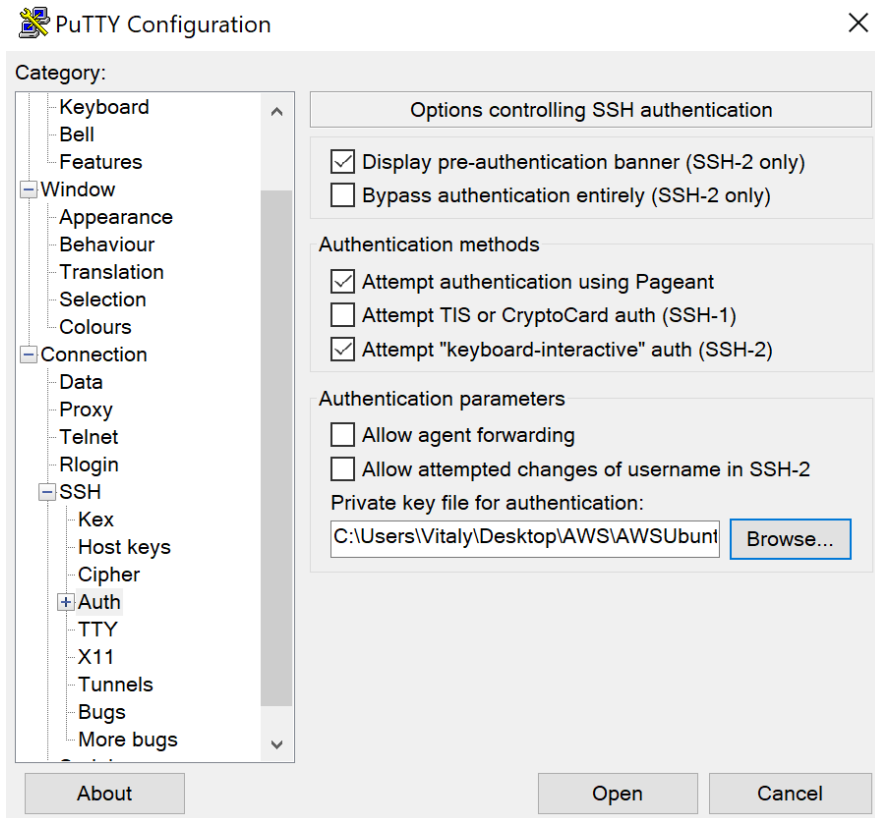

Click “OK” and then click on “Save private key” (you can save it to the same folder where your AWS key is because technically, they are the same keys but in a different format: one is formatted for SSH client (extension .pem) and another for putty client (extension .ppk).

It will ask you if you want to save it without the password, say Yes. You can save it with a different name like AWSUbuntu_putty.

Close puttygen and open putty. In putty, enter your machine’s IP address in the appropriate field:

Then navigate to SSH on the left menu in putty, click on Auth and on the right side select “Private key for authentication” which should be your key generated by puttygen (AWSUbuntu_putty.ppk).

Click on open. Select “Yes” to the security alert. Enter the username as ubuntu:

Press Enter and you should be in:

```
ubuntu@ip-172-31-94-35: ~  
System load: 0.0          Processes:            84

```

Set up VNC and remote desktop for Ubuntu

If you want to set up a remote desktop with a graphical user interface for connecting to your machine instead of using the terminal, following this section. Otherwise, skip it.

Installation

Connect to your Ubuntu machine using putty on Windows or SSH command on Mac OS / Linux. VNC server is the software that allows you to connect remotely using a graphical user interface.

Type the following commands in the terminal to download the software and install it on your server:

```
sudo apt-get update  
sudo apt-get install ubuntu-desktop  
sudo apt-get install gnome-panel gnome-settings-daemon metacity nautilus gnome-terminal  
sudo apt-get install vnc4server  
vncserver
```

Enter your password you will use for the remote desktop. After that, it will tell you that vncserver has started.

Configuration

Now, type the following to kill it and then edit the settings.

```
vncserver -kill :1  
nano .vnc/xstartup
```

Delete everything from the file (using Delete or Backspace keys and keyboard-arrows to do it) and write the following in it (copy from here and right-click -> paste):

```
#!/bin/sh

export XKL_XMODMAP_DISABLE=1
unset SESSION_MANAGER
unset DBUS_SESSION_BUS_ADDRESS

[ -x /etc/vnc/xstartup ] && exec /etc/vnc/xstartup
[ -r $HOME/.Xresources ] && xrdb $HOME/.Xresources
xsetroot -solid grey
vncconfig -iconic &

gnome-panel &
gnome-settings-daemon &
metacity &
nautilus &
gnome-terminal &
```

Press CTRL + X (without the plus, just CTRL X) on your keyboard. At the bottom of the terminal text editor, you should see a message asking if you want to save the changes. Press Y. Now, it should ask you where you want to save the file. By default, it will show you the name of this file in any case, so just press ENTER again.

Firewall Rule on EC2

Add a firewall rule on EC2 for this machine to open port *tcp*:5901. To do that, open EC2 Instance, select your instance, and click on the “launch-wizard-..” at the bottom under Description -> Security groups:

Edit

Type	Protocol	Port Range	Source	Description
SSH	TCP	22	0.0.0.0/0	

After selecting Edit, you will see something like this:

Edit inbound rules

Type ⓘ	Protocol ⓘ	Port Range ⓘ	Source ⓘ	Description ⓘ
SSH ▾	TCP	22	Custom ▾ 0.0.0.0/0	e.g. SSH for Admin

Add Rule

NOTE: Any edits made on existing rules will result in the edited rule being deleted and a new rule created with the new details. This will cause traffic on that rule to be dropped for a very brief period of time until the new rule can be created.

Click on “Add Rule” to allow clients to connect to your VNCserver on your Ubuntu and add the following rule:

Edit inbound rules

Type ⓘ	Protocol ⓘ	Port Range ⓘ	Source ⓘ	Description ⓘ
SSH ▾	TCP	22	Custom ▾ 0.0.0.0/0	e.g. SSH for Admin
Custom TCP ▾	TCP	5901	Anywhere ▾ 0.0.0.0/0, ::/0	e.g. SSH for Admin

Add Rule

NOTE: Any edits made on existing rules will result in the edited rule being deleted and a new rule created with the new details. This will cause traffic on that rule to be dropped for a very brief period of time until the new rule can be created.

Click on Save.

Run VNC Server

Go back to the terminal where you have been working on installing the VNCserver and editing the configuration file on Ubuntu. Type the following command and press ENTER. It will launch vncserver again; this time you can also specify what resolution you want it to work at via '-geometry' parameter.

```
vncserver -geometry 1280x720
```

It should be up and running and waiting for you to connect to it. On your current machine, install Portable TightVNC (or RealVNC if you have admin privileges). You can use any other VNC client that is applicable to your operating system. Chrome has a VNS plugin that will also work as your browser app.

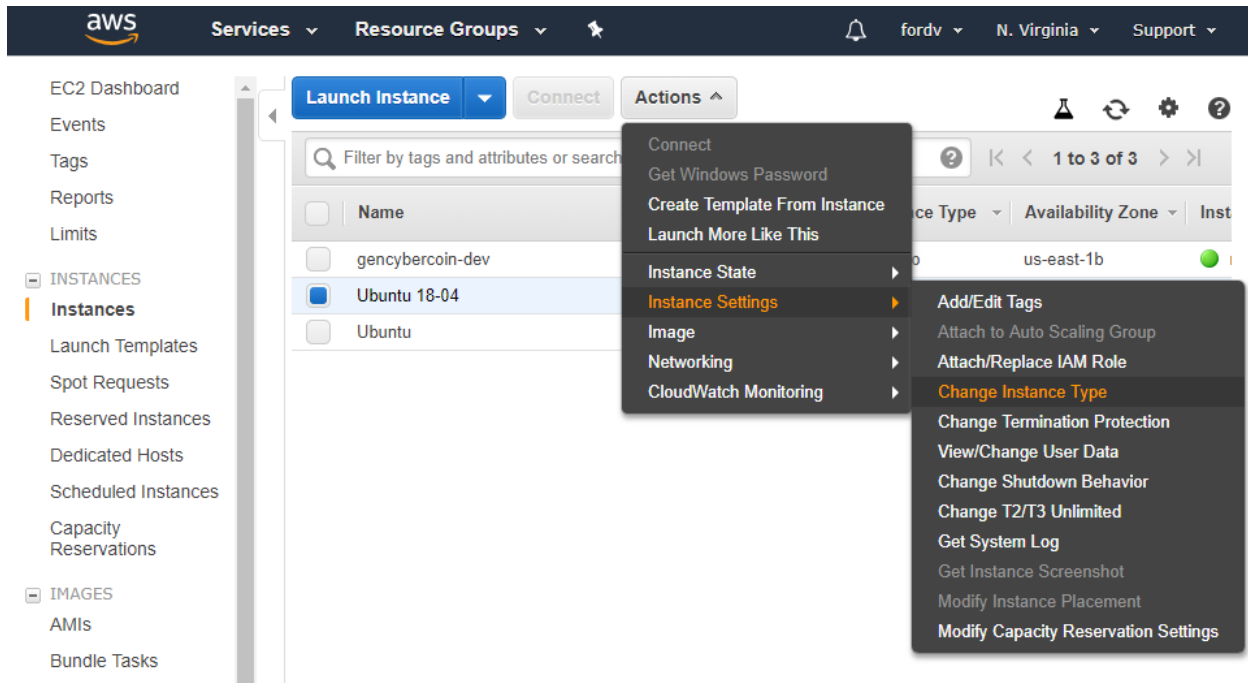

Connect to your ubuntu through the VNC client of your choice, use the public IP address of the Ubuntu machine bundled with **::5901** at the end (do not forget that double-colon in front of 5901). If double colon did not work, try just one colon in front of 5901.

EC2 Hardware Changes

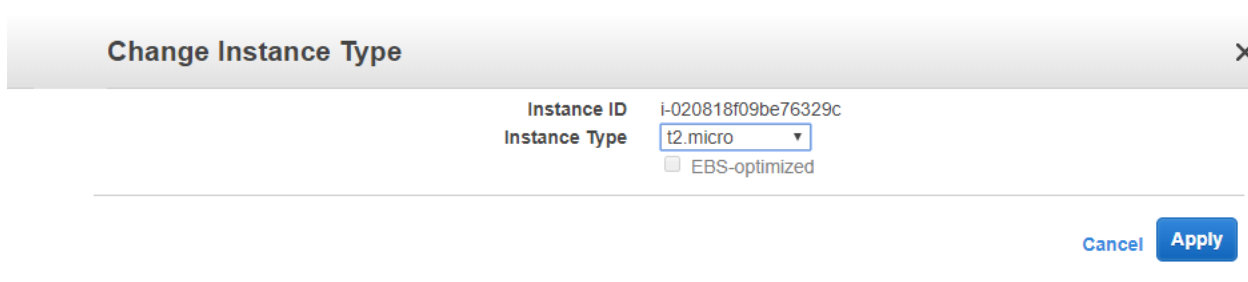

You can change the hardware configuration of your virtual machine instance at any time you want.

First, stop the instance for which you plan to update the hardware configuration.

Second, select the instance, navigate to Actions -> Instance Settings and click on Change Instance Type:

Select the instance type you want to change it to and click Apply. Done. You do not have to worry about your data getting lost, only the hardware will change:

To learn about different available instance types, their hardware specs, and cost, you can navigate to <https://aws.amazon.com/ec2/pricing/on-demand/>

Cloud9

From official AWS Cloud9 description: “AWS Cloud9 allows you to write, run, and debug your code with just a browser. With AWS Cloud9, you have immediate access to a rich code editor, integrated debugger, and built-in terminal with preconfigured AWS CLI. You can get started in minutes and no longer have to spend the time to install local applications or configure your development machine.”

The best part of Cloud9 is that you can collaborate with other people, editing the code at the same exact time, live! You do not have to worry about setting up the software on your machine, and you always have access to your projects that can be instantly tested and made publicly available on the Internet when you need it.

Cost Calculator

If you want to estimate the cost of all AWS services that you plan to use, navigate to <https://calculator.s3.amazonaws.com/index.html>

AWS has 3 different pricing models (pay-as-you-go, save when you reserve upfront, and pay less by using more). You can learn more about those here: <https://aws.amazon.com/pricing/>

Other AWS Cloud Services

For other services, it is actually easier to connect to and use them because there are extensive manuals and tutorials available.

Their user interface is very friendly. However, if you have any specific questions for a particular case, please email fordv@arcadia.edu and we will make it work.

What is Next?

Spread the word! Email me about any questions, especially if you are looking for a cloud solution that will help your teaching/research/capstones at Arcadia.

AWS provides a lot of free training material and videos that students and faculty can use to learn about cloud computing at their own pace. You will be able to find those materials in awseducate.com portal, under Professional Development.
